*These reports have been peer reviewed by colleagues at the University of Nebraska. Any questions, suggestions, or concerns should be sent directly to the author(s).

All of the Center's research reports detailing Nebraska Rural Poll results are located on the Center's World Wide Web page at http://cari.unl.edu/ruralpoll/

Funding for this project was provided by the Cooperative Extension Division of the Institute for Agriculture and Natural Resources, the Agricultural Research Division of the Institute for Agriculture and Natural Resources, and the Center for Applied Rural Innovation. Additionally, considerable in-kind support and contributions were provided by a number of individuals and organizations associated with the Partnership for Rural Nebraska, the University of Nebraska Rural Initiative and the University of Nebraska Public Policy Center. A special note of appreciation is extended to the staff at the Pierce County Extension Office for the space needed to conduct this survey and to the Nebraska Library Commission for use of the laptops.

## Executive Summary

Many rural communities have experienced population growth during the past decade and the state has experienced relatively stable economic conditions during the past year. How do rural Nebraskans feel about their community? Are they satisfied with the services provided? Are they planning to move from their community next year? How do rural Nebraskans perceive their quality of life? Do their perceptions differ by community size, the region in which they live, or their occupation?

This report details 2,680 responses to the 2007 Nebraska Rural Poll, the twelfth annual effort to understand rural Nebraskans' perceptions. Respondents were asked a series of questions about their community and individual well-being. Trends for some of these questions are examined by comparing data from the eleven previous polls to this year's results. For all questions, comparisons are made among different respondent subgroups, that is, comparisons by age, occupation, region, etc. Based on these analyses, some key findings emerged:

- During the past four years, the proportion of rural Nebraskans that have viewed positive change in their communities has increased. Following a seven year period of general decline, the proportion saying their community has changed for the better increased from 23 percent in 2003 (the lowest point over the twelve year period) to 33 percent this year. (page 3)

## - By many different measures, rural Nebraskans are positive about their community.

$\checkmark$ Many rural Nebraskans rate their community favorably on its social dimensions. Many rural Nebraskans rate their communities as friendly (72\%), trusting (59\%) and supportive (65\%). (page 10)
$\checkmark$ Many rural Nebraskans express positive sentiments about their community. Approximately two-thirds (67\%) agree with the statement that "my community is very special to me." And 62 percent agree with the statement that "I feel I can really be myself in my community." (page 13)
$\checkmark$ One-half of rural Nebraskans say it would be difficult to leave their community. Fifty percent say it would be difficult for their household to leave their community. Approximately one-third (32\%) indicate it would be easy for their household to leave their community and 18 percent gave a neutral response. (page 14)

- Rural Nebraskans continue to be generally positive about their current situation. Each year the proportion of rural Nebraskans that say they are better off than they were five years ago has been greater than the proportion saying they are worse off than they were five years ago. And, during the past four years, the proportion of rural Nebraskans saying they are worse off than they were five years ago has declined from 28 percent in 2003 to 15 percent this year. The proportion believing they are better off than they were five years ago has generally increased during this same four-year time period. The proportion saying
they are better off first increased from 32 percent in 2003 to 45 percent in 2005. The proportion then dipped to 39 percent last year before increasing again to 44 percent this year. (page 6)
- Similarly, rural Nebraskans continue to be generally positive about their future. The proportion that say they will be better off ten years from now has always been greater than the proportion saying they will be worse off ten years from now. The proportion stating they will be better off ten years from now has generally remained about 41 percent. This year, the proportion was 41 percent. Eighteen percent believe they will be worse off ten years from now. (page 7)
- Following trends in previous years, rural Nebraskans are most satisfied with their marriage, family, friends, religion/spirituality and the outdoors. They continue to be less satisfied with job opportunities, current income level and financial security during retirement. (page 5)
- While residents living in or near larger communities are more likely to view positive change in their communities, residents of smaller communities are more likely to rate their community favorably on its social dimensions and to have positive sentiments about their community.
$\checkmark$ Residents living in or near larger communities are more likely than residents of smaller communities to say their community has changed for the better during the past year. Thirty-eight percent of persons living in or near communities with populations of 10,000 or more believe their community has changed for the better, compared to 19 percent of persons living in or near communities with less than 500 people. (page 10)
$\checkmark$ Residents living in or near the smallest communities are more likely than persons living in or near larger communities to rate their community as friendly and trusting. Approximately 65 percent of persons living in or near communities with populations under 1,000 say their community is trusting, compared to 55 percent of persons living in or near communities with populations of 5,000 or more. (page 10)
$\checkmark$ Persons living in or near smaller communities are more likely than persons living in or near larger communities to express positive sentiments about their community. Fifty-three percent of persons living in or near communities with less than 500 people agree with the statement that my community is my favorite place to be. In comparison, approximately 40 percent of persons living in or near communities with populations of 5,000 or more agree with this statement. (page 13)
- Except for a few services that are largely unavailable in rural communities, rural Nebraskans are generally satisfied with basic community services and amenities. At least 70 percent of rural Nebraskans are satisfied with the following services or amenities: fire protection (85\%), parks and recreation (74\%), library services (74\%) and religious organizations (72\%). On the other hand, at least one-third of rural Nebraskans are
dissatisfied with the entertainment, retail shopping, restaurants, streets and roads, arts/cultural activities, local government and public transportation services in their community. (page 11)
- Persons with the highest household incomes are more likely than persons with lower incomes to feel they are better off compared to five years ago, are better off compared to their parents when they were their age, and will be better off ten years from now. For example, 62 percent of respondents with household incomes of $\$ 60,000$ or more think they are better off then they were five years ago. However, only 29 percent of respondents with household incomes under $\$ 20,000$ believe they are better off than they were five years ago. (page 17)
- Persons with lower education levels are more likely than persons with more education to believe that people are powerless to control their own lives. Forty-nine percent of persons with a high school diploma or less education agree that people are powerless to control their own lives. However, only 26 percent of persons with a four-year college degree share this opinion. (page 18)

## Introduction

Recent community level Census data show that many communities in Nebraska have experienced growth. In addition, Nebraska has experienced relatively stable economic conditions during the past year.

Given these conditions, how do rural Nebraskans feel about their community? Are they satisfied with the services provided by their community? Are they planning to move from their community in the next year? How do rural Nebraskans believe they are doing and how do they view their future? Have these views changed over the past twelve years? How satisfied are they with various items that influence their wellbeing? This paper provides a detailed analysis of these questions.

The 2007 Nebraska Rural Poll is the twelfth annual effort to understand rural Nebraskans' perceptions. Respondents were asked a series of questions about their community and individual well-being. Trends for these questions will be examined by comparing the data from the eleven previous polls to this year's results.

## Methodology and Respondent Profile

This study is based on 2,680 responses from Nebraskans living in the 84 nonmetropolitan counties in the state. A selfadministered questionnaire was mailed in February and March to approximately 6,400 randomly selected households. Metropolitan counties not included in the sample were Cass, Dakota, Dixon, Douglas, Lancaster, Sarpy, Saunders, Seward and Washington. The 14-page questionnaire included questions pertaining to well-being,
community, retirement issues, work, and immigration. This paper reports only results from the community and well-being portions of the survey.

A $40 \%$ response rate was achieved using the total design method (Dillman, 1978). The sequence of steps used follow:

1. A pre-notification letter was sent requesting participation in the study.
2. The questionnaire was mailed with an informal letter signed by the project director approximately seven days later.
3. A reminder postcard was sent to the entire sample approximately seven days after the questionnaire had been sent.
4. Those who had not yet responded within approximately 14 days of the original mailing were sent a replacement questionnaire.

In addition to the standard random sample of rural households, this year's questionnaire was also distributed both randomly and nonrandomly to Latinos in three communities (Grand Island, Lexington and Crete) in order to increase responses received from Latinos. Out of the returned surveys in these communities, 151 self-identified themselves as Spanish, Hispanic or Latino. The Latino respondents were combined with the respondents from the random rural sample for this report in order that the total proportion of Latino respondents would mirror the proportion of Latinos living in rural Nebraska.

Appendix Table 1 shows demographic data from this year's study and previous rural polls, as well as similar data based on the entire non-metropolitan population of Nebraska (using 2000 U.S. Census data). As can be seen from the table, there are
some marked differences between some of the demographic variables in our sample compared to the Census data. Certainly some variance from 2000 Census data is to be expected as a result of changes that have occurred in the intervening seven years. Nonetheless, we suggest the reader use caution in generalizing our data to all rural Nebraska. However, given the random sampling frame used for this survey, the acceptable percentage of responses, and the large number of respondents, we feel the data provide useful insights into opinions of rural Nebraskans on the various issues presented in this report. The margin of error for this study is plus or minus two percent.

Since younger residents have typically been under-represented by survey respondents and older residents have been overrepresented, weights were used to adjust the sample to match the age distribution in the non-metropolitan counties in Nebraska (using U.S. Census figures). Even though this is the first year that such weighting has been utilized in the data analysis, data from the previous polls were weighted in a similar fashion for the trend comparisons included in this report.

The average age of respondents is 50 years. Seventy percent are married (Appendix Table 1) and 70 percent live within the city limits of a town or village. On average, respondents have lived in Nebraska 41 years and have lived in their current community 27 years. Forty-nine percent are living in or near towns or villages with populations less than 5,000. Ninety percent have attained at least a high school diploma.

Forty-eight percent of the respondents report their 2006 approximate household income
from all sources, before taxes, as below $\$ 40,000$. Thirty-nine percent report incomes over $\$ 50,000$.

Seventy-four percent were employed in 2006 on a full-time, part-time, or seasonal basis. Nineteen percent are retired. Fortyone percent of those employed reported working in a professional, technical or administrative occupation. Ten percent indicated they were farmers or ranchers.

## Trends in Community Ratings (1996 2007)

Comparisons are made between the community data collected this year to the eleven previous studies. These were independent samples (the same people were not surveyed each year).

## Community Change

To examine respondents' perceptions of how their community has changed, they were asked the question, "Communities across the nation are undergoing change. When you think about this past year, would you say...My community has changed for the..." Answer categories were better, no change or worse.

One difference in the wording of this question has occurred over the past twelve years. Starting in 1998, the phrase "this past year" was added to the question; no time frame was given to the respondents in the first two studies. Also, last year the middle response "same" was replaced with "no change."

During the past four years, the proportion of rural Nebraskans that have viewed positive

change in their communities has increased (Figure 1). Following a seven year period of general decline, the proportion saying their community has changed for the better increased from 23 percent in 2003 (the lowest point over the twelve year period) to 33 percent this year. This pattern seems to follow the economic conditions that existed in the state during this time period.

The proportion saying their community has stayed the same first increased from 1996 to 1998. It then remained fairly steady during the following eight years but has since declined the past two years. The proportion saying their community has changed for the worse has remained fairly steady across all twelve years.

## Community Social Dimensions

Respondents were also asked each year if they would describe their communities as
friendly or unfriendly, trusting or distrusting, and supportive or hostile. For each of these three dimensions, respondents were asked to rate their community using a seven-point scale between each pair of contrasting views.

The proportion of respondents who view their community as friendly has remained fairly steady over the twelve year period, ranging from 69 to 75 percent. The proportion of respondents who view their community as trusting have also remained fairly steady, ranging from 59 to 66 percent. A similar pattern emerged when examining the proportion of respondents who rated their community as supportive. The proportions rating their community as supportive have ranged from 60 percent to 67 percent over the twelve year period.

## Plans to Leave the Community

Starting in 1998, respondents were asked, "Do you plan to move from your community in the next year?" The proportion planning to leave their community has remained relatively stable during the past ten years, ranging from 3 percent to 6 percent.

The expected destination for the persons planning to move has changed over time (Figure 2). During the past three years of this study, the proportion of expected movers planning to move to either the Omaha or Lincoln area has increased from 8 percent in 2004 to 22 percent this year (the highest proportion during the ten year period). During this same three year time period, the proportion planning to leave Nebraska has generally decreased. In 2004, 54 percent of expected movers planned to leave the state. This proportion steadily

Figure 2. Expected Destination of Those Planning to Move:

1998-2007

decreased to 36 percent last year and then increased slightly to 39 percent this year.

## Satisfaction with Community Services and Amenities

Respondents were also asked how satisfied they are with various community services and amenities each year. They were asked this in all twelve studies; however, in 1996 they were also asked about the availability of these services. Therefore, comparisons will only be made between the last eleven studies, when the question wording was identical. The respondents were asked how satisfied they were with a list of 24 services and amenities, taking into consideration availability, cost, and quality.

Table 1 shows the proportions very or somewhat satisfied with the service each year. The rank ordering of these items has remained relatively stable over the eleven years. However, the proportion of rural Nebraskans satisfied with many social services has declined across all eleven years of the study. In addition, a few services had significant declines this year. Medical care services, senior centers, nursing home care, day care services, and Head Start programs all had significant declines in the proportions satisfied with each service this year. As an example, the proportion of rural Nebraskans satisfied with day care services in their community has steadily declined across all eleven years, from 51 percent in 1997 to 31 percent this year.

## Trends in Well-Being (1996-2007)

Comparisons are made between the wellbeing data collected this year to the eleven previous studies. These comparisons show a clearer picture of the trends in the wellbeing of rural Nebraskans.

## General Well-Being

To examine perceptions of general wellbeing, respondents were asked four questions.

1. "All things considered, do you think you are better or worse off than you were five years ago?" (Answer categories were worse off, about the same, or better off).
2. "All things considered, do you think you are better or worse off than your parents when they were your age?"
3. "All things considered, do you think you will be better or worse off ten years from now than you are today?"

4. "Do you agree or disagree with the following statement? Life has changed so much in our modern world that most people are powerless to control their own lives."

When examining the trends over the past twelve years, rural Nebraskans have generally given positive reviews about their current situation (Figure 3). Each year the proportion of rural Nebraskans that say they are better off than they were five years ago has been greater than the proportion saying they are worse off than they were five years ago. And, during the past four years, the proportion of rural Nebraskans saying they are worse off than they were five years ago has declined from 28 percent in 2003 to 15 percent this year. The proportion believing

Figure 3. Well-Being Compared to Five Years Ago: 1996-2007

they are better off than they were five years ago has generally increased during this same four-year time period. The proportion saying they are better off first increased from 32 percent in 2003 to 45 percent in 2005. The proportion then dipped to 39 percent last year before increasing again to 44 percent this year.

When asked to compare themselves to their parents when they were their age, the responses have been very stable over time (Figure 4). The proportion stating they are better off has averaged 59 percent over the twelve year period. Similarly, the proportion feeling they are worse off than their parents has remained steady at approximately 16 percent during this period.

When looking to the future, respondents’

Figure 4. Well-Being Compared to Parents: 1996-2007

Research Report 07-1 of the Center for Applied Rural Innovation
Page 6

views have also been generally positive (Figure 5). The proportion that say they will be better off ten years from now has always been greater than the proportion saying they will be worse off ten years from now. The gap between the two proportions was widest in 1998 and 2005. The gap narrowed somewhat in 2003.

The proportion stating they will be better off ten years from now has generally remained about 41 percent. In 2003, the proportion fell to 37 percent, the lowest of all 12 years. The proportion of respondents stating they will be worse off ten years from now has been approximately 19 percent each year. In 1996 the proportion saying they would be worse off ten years from now was 28 percent, the highest of all 12 years. The proportion has declined to 18 percent this
year.
In addition to asking about general wellbeing, rural Nebraskans were asked about the amount of control they feel they have over their lives. To measure this, respondents were asked the extent to which they agreed or disagreed with the following statement:
"Life has changed so much in our modern world that most people are powerless to control their own lives."

Responses to this question remained fairly consistent over the first ten years (Figure 6). The proportion who either strongly disagree or disagree with the statement has declined since 2002, from 58 percent to 44 percent this year, the lowest of the 12 -year period. The proportion that either strongly agree or

Figure 6. "...People are
Powerless to Control Their Lives": 1996-2007

agree with the statement has remained fairly consistent each year, averaging around 33 percent. However, the proportion has increased during the past three years, from 30 percent in 2005 to 38 percent this year. This is the highest proportion in all 12 years of the study. The proportion of those who were undecided each year has gradually increased over time, from 10 percent in 1996 to 18 percent this year.

## Satisfaction with Specific Aspects of Life

Each year, respondents were also given a list of items that can affect their well-being and were asked to indicate how satisfied they were with each using a five-point scale ( $1=$ very dissatisfied, 5 = very satisfied). They were also given the option of checking a box to denote "does not apply."

This same question was asked in the eleven previous polls, but the list of items was not identical each year. Table 2 shows the proportions very or somewhat satisfied with each item for each study period.

The rank ordering of the items has remained relatively stable over the years. In addition, the proportion of respondents stating they were very or somewhat satisfied with each item also has been fairly consistent over the years. However, the proportion of rural Nebraskans satisfied with both clean air and clean water dropped this year. During the past seven years, the proportion of rural Nebraskans satisfied with clean air has averaged approximately 80 percent. This proportion dropped to 74 percent this year. Similarly, the proportion of rural Nebraskans satisfied with clean water has averaged approximately 74 percent during the past seven years, but declined to 68
percent this year.
Items generally fall into three levels of satisfaction ratings. Family, friends, the outdoors, spirituality, their health and education continue to be items given high satisfaction ratings by respondents. Items in the middle category include job satisfaction, job security, their spare time and their community. On the other hand, respondents continue to be less satisfied with job opportunities, their current income level, and financial security during retirement.

## The Community and Its Attributes in 2007

In this section, the 2007 data on respondents’ evaluations of their communities and its attributes are examined in terms of any significant differences that may exist depending upon the size of the respondent's community, the region in which they live, or various individual attributes such as household income or age.

## Community Change

The perceptions of the change occurring in their community by various demographic subgroups are examined (Appendix Table 2). Residents living in or near the largest communities are more likely than persons living in or near the smallest communities to say that their community has changed for the better. Thirty-eight percent of persons living in or near communities with populations of 10,000 or more believe their community has changed for the better, compared to 19 percent of persons living in or near communities with less than 500 people (Figure 7). Persons living in or near the smallest communities are more likely than persons living in or near larger

Note: The list of items was not identical in each study. "NA" means that item was not asked that particular year.

* The proportions were calculated out of those answering the question. The respondents checking "does not apply" were not included in the calculations.
** Worded as "time to relax during the week" in 1996 study.
communities to say their community did not change during the past year.

The other groups most likely to say their community has changed for the better include: persons between the ages of 30 and

39, respondents with the highest household incomes, persons with the highest education levels and Latinos. When comparing responses by region, persons living in both the Panhandle and Southeast regions of the state were the groups least likely to say their community has changed for the better during the past year (see Appendix Figure 1 for the counties included in each region).

## Community Social Dimensions

In addition to asking respondents about their perceptions of the change occurring in their community, they were also asked to rate its social dimensions. They were asked if they would describe their communities as friendly or unfriendly, trusting or distrusting, and supportive or hostile. Overall, respondents rate their communities as friendly (72\%), trusting (59\%) and supportive (65\%).

Respondents' ratings of their community on these dimensions differ by some of the
characteristics examined (Appendix Table 3). Persons living in or near the smallest communities are more likely than persons living in or near the largest communities to rate their community as both friendly and trusting. Approximately 65 percent of persons living in or near communities with populations under 1,000 say their community is trusting, compared to 55 percent of persons living in or near communities with populations of 5,000 or more.

When comparing responses by age, persons age 65 and older are more likely than younger respondents to view their community as friendly, trusting and supportive. Widowed respondents are the marital group most likely to view their community as friendly, trusting and supportive. As an example, 69 percent of widowed respondents say their community is trusting, compared to 47 percent of persons who are either divorced/ separated or who have never married.

Farmers and ranchers are the occupation group most likely to view their community as friendly, trusting and supportive. Eighty-one percent of farmers and ranchers rate their community as friendly, compared to 55 percent of persons with occupations classified as "other."

Non-Latinos are more likely than Latinos to view their community as trusting. Sixty percent of non-Latinos rate their community as trusting, compared to 50 percent of Latinos.

## Satisfaction with Community Services and Amenities

Next, rural residents were asked to rate how
satisfied they are with 24 different services and amenities, taking into consideration cost, availability, and quality. Residents report high levels of satisfaction with some services, but other services and amenities have higher levels of dissatisfaction. Only four services listed have a higher proportion of dissatisfied responses than satisfied responses and those services are largely unavailable in rural communities.

The services or amenities respondents are most satisfied with (based on the combined percentage of "very satisfied" or "somewhat satisfied" responses) include: fire protection (85\%), library services (74\%), parks and recreation (74\%), religious organizations (72\%), education (K-12) (68\%) and sewage/ waste disposal (66\%) (Appendix Table 4). At least one-third of the respondents are either "very dissatisfied" or "somewhat dissatisfied" with entertainment (50\%), retail shopping (47\%), restaurants (41\%), streets and roads (39\%), arts/cultural activities (37\%), local government (35\%) and public transportation services (33\%).

The ten services and amenities with the greatest dissatisfaction ratings were analyzed by community size, region and various individual attributes (Appendix Table 5). Many differences emerge.

Younger respondents are more likely than older respondents to be dissatisfied with the entertainment, retail shopping and restaurants in their community. As an example, 60 percent of persons between the ages of 19 and 39 are dissatisfied with entertainment, compared to only 28 percent of persons age 65 and older.

When comparing responses by household
income, persons with higher household incomes are more likely than persons with lower incomes to be dissatisfied with the entertainment, retail shopping and restaurants in their community.

Persons with higher education levels are more likely than persons with less education to be dissatisfied with the entertainment, retail shopping and restaurants in their community. When comparing responses by occupation, persons with occupations classified as "other" and persons with professional occupations are the groups most likely to be dissatisfied with their community's entertainment, retail shopping and restaurants.

Non-Latinos are more likely than Latinos to say they are dissatisfied with their community's retail shopping and restaurants. As an example, 49 percent of non-Latinos are dissatisfied with the retail shopping in their community, compared to 31 percent of Latinos.

Persons living in the Panhandle region are more likely than persons living in other regions of the state to express dissatisfaction with the retail shopping in their community.

The persons who have never married are more likely than the other marital groups to express dissatisfaction with the entertainment in their community. Married persons are the marital group most likely to be dissatisfied with the retail shopping in their community. The widowed respondents are the marital group least likely to express dissatisfaction with the restaurants in their community.

Persons living in the both the North Central and Panhandle regions are more likely than
persons living in other regions of the state to express dissatisfaction with their streets and roads. Approximately 46 percent of persons living in these two regions are dissatisfied with their streets and roads, compared to 34 percent of residents of the Southeast region.

Other groups most likely to express dissatisfaction with their streets and roads include: persons age 19 to 64, non-Latinos, persons who are divorced/separated, persons who have never married, and persons with some college education.

The groups most likely to be dissatisfied with their arts/cultural activities include: persons with the highest household incomes, persons under the age of 65 , respondents who have never married, persons with the highest education levels and persons with occupations classified as "other."

Persons age 40 to 64 are the age group most likely to express dissatisfaction with their local government. Forty-two percent of persons age 40 to 64 are dissatisfied with their local government, compared to 29 percent of persons under the age of 40 or over the age of 65. The divorced/separated respondents are more likely than persons with a different marital status to be dissatisfied with their local government.

Non-Latinos are more likely than Latinos to be dissatisfied with their local government (36 percent compared to 24 percent). Latinos are more likely than non-Latinos to have no opinion on their local government. Almost one-half (46\%) of Latinos have no opinion about their local government.

Persons living in the Panhandle are more likely than persons living in different regions
of the state to be dissatisfied with public transportation services in their community. Forty-three percent of persons living in the Panhandle are dissatisfied with their public transportation services, compared to 26 percent of persons living in the North Central region.

Latinos are more likely than non-Latinos to express dissatisfaction with the public transportation services in their community. Almost one-half (49\%) of Latinos are dissatisfied with the public transportation services, compared to 31 percent of nonLatinos.

Other groups most likely to be dissatisfied with their public transportation services include: persons living in or near the largest communities, both respondents who have never married or are divorced/separated, and persons with occupations classified as "other."

Persons living in or near smaller communities are more likely than persons living in or near larger communities to express dissatisfaction with the cellular phone service in their community. Fortythree percent of persons living in or near communities with less than 500 people are dissatisfied with their community's cellular phone service, compared to 21 percent of persons living in or near communities with populations of 5,000 or more.

Persons living in the Panhandle, North Central and Southeast regions are more likely than persons living in other regions of the state to express dissatisfaction with their cellular phone service. Approximately 34 percent of residents of these three regions are dissatisfied with their cellular phone service,
compared to 22 percent of persons living in the South Central region.

The age and marital groups most likely to express dissatisfaction with the cellular phone service in their community are the persons under the age of 65 and both married persons and respondents who are divorced/separated.

Persons with the highest education levels are more likely than persons with lower educational levels to be dissatisfied with their community recycling. Thirty percent of persons with at least a four-year college degree are dissatisfied with their community recycling, compared to 20 percent of persons with a high school diploma or less education.

Persons under the age of 65 are more likely than persons over the age of 65 to be dissatisfied with their community recycling. The widowed respondents are the marital group least likely to express dissatisfaction with their community recycling.

Persons living in or near the smallest communities are more likely than persons living in or near the larger communities to
express dissatisfaction with their law enforcement. Thirty-five percent of persons living in or near communities with less than 500 people are dissatisfied with their law enforcement. However, only 21 percent of persons living in or near communities with populations of 5,000 or more are dissatisfied with this service.

Persons under the age of 65 are the age group most likely to express dissatisfaction with their law enforcement. The widowed respondents are the marital group least likely to express dissatisfaction with their community's law enforcement.

## Feelings About Community

The respondents were next given some statements about their community and were asked the extent to which they agree or disagree with each. Approximately twothirds (67\%) agree with the statement that "my community is very special to me." (Figure 8) And 62 percent agree with the statement that "I feel I can really be myself in my community."

Figure 8. Feelings About Community

Research Report 07-1 of the Center for Applied Rural Innovation
Page 13

Responses to this question differ by many of the characteristics examined (Appendix Table 6). Persons living in or near smaller communities are more likely than persons living in or near larger communities to express positive sentiments about their community. Persons living in or near the smallest communities are more likely than residents of larger communities to agree with three of these statements about their community. As an example, 53 percent of persons living in or near communities with less than 500 people agree with the statement that my community is my favorite place to be. In comparison, approximately 40 percent of persons living in or near communities with populations of 5,000 or more agree with this statement.

Older persons are more likely than younger persons to agree with each statement listed. For example, 63 percent of persons age 65 and older agree with the statement that I really miss my community when I am away too long, compared to 38 percent of persons under the age of 30 .

Long term residents are more likely than newcomers to the community to express positive sentiments about their community. As an example, 50 percent of persons living in their community for more than five years agree with the statement I really miss my community when I am away too long, compared to 32 percent of persons living in the community for five years or less.

Farmers and ranchers are the occupation group most likely to express positive sentiments about their community. Eightyone percent of farmers and ranchers agree with the statement that my community is very special to me, compared to 30 percent of
persons with occupations classified as "other."

When comparing responses by marital status and education, widowed respondents and persons with a high school diploma or less education are the groups most likely to agree with each statement.
Persons with the lowest household incomes are more likely than persons with higher incomes to agree with the statements that no other place can compare to my community and my community is my favorite place to be.

Next, respondents were asked a question about how easy or difficult it would be to leave their community. The exact question wording was "Assume you were to have a discussion in your household about leaving your community for a reasonably good opportunity elsewhere. Some people might be happy to live in a new place and meet new people. Others might be very sorry to leave. How easy or difficult would it be for your household to leave your community?" They were given a seven point scale where 1 indicated very easy and 7 denoted very difficult. One-half (50\%) of rural Nebraskans say it would be difficult to leave their community ${ }^{1}$ (Figure 9). Approximately one-third (32\%) indicate it would be easy for their household to leave their community.

Responses to this question are examined by region, community size and various individual attributes (Appendix Table 7).
Many differences emerge.

[^0]

Older persons are more likely than younger persons to say it would be difficult to leave their community. Sixty-two percent of persons age 65 or older think it would be difficult to leave their community, compared to 38 percent of persons age 19 to 29 .

Similarly, widowed persons are the marital group most likely to say it would be difficult to leave their community. Sixty percent of widowed respondents believe it would be difficult to leave their community, compared to 41 percent of persons who have never married.

Long term residents of the community are more likely than newcomers to say it would be difficult to leave their community. Fiftythree percent of persons who have lived in their community for more than five years say it would be difficult to leave their community, compared to 37 percent of persons living in the community for five years or less (Figure 10).

Other groups most likely to say it would be difficult to leave their community include persons with the lowest education levels and farmers and ranchers. When comparing

Figure 10. Ease or Difficulty Leaving Community by Length of Residence in Community

responses by region, persons living in the Panhandle are more likely than persons living in other regions of the state to say it would be easy to leave their community. Forty-two percent of persons living in the Panhandle said it would be easy to leave their community, compared to 29 percent of persons living in the Northeast region of the state.

## Plans to Leave the Community

To determine rural Nebraskans’ migration intentions, respondents were asked, "Do you plan to move from your community in the next year?" Response options included yes, no or uncertain. A follow-up question (asked only of those who indicated they were planning to move) asked where they planned to move. The answer categories for this question were: Lincoln/Omaha metro areas, some place in Nebraska outside the Lincoln/Omaha metro areas, or some place other than Nebraska.

Only six percent indicate they are planning to move from their community in the next year, 12 percent are uncertain and 83 percent have
no plans to move. Of those who are planning to move, 61 percent plan to remain in the state, with 22 percent planning to move to either the Lincoln or Omaha area and 39 percent plan to move to another part of the state. Thirty-nine percent are planning to leave Nebraska.

Intentions to move from their community differed by many of the characteristics examined (Appendix Table 8). Younger respondents are more likely than older respondents to be planning to move from their community in the next year. Thirteen percent of persons between the ages of 19 and 29 are planning to move next year, compared to only three percent of persons age 65 and older. An additional 20 percent of the younger respondents indicate they are uncertain if they plan to move.

Latinos are more likely than non-Latinos to be planning to move from their community in the next year. Sixteen percent of Latinos are planning to move in the next year, compared to four percent of non-Latinos. Another twenty percent of Latinos are uncertain if they plan to move from their community next year.

Persons who have never married are the marital group most likely to be planning to move from their community in the next year. Sixteen percent of persons who have never married are planning to move and an additional 20 percent are uncertain if they plan to move.

Potential movers from the largest communities are more likely than potential movers from smaller communities to be planning to move to either the Lincoln/ Omaha metropolitan areas or out of

Nebraska.
Respondents with the lowest household incomes who are planning to move from their community in the next year are more likely than potential movers with higher household incomes to plan to move out of Nebraska.

## General Well-Being by Subgroups

In this section, 2007 data on the four general measures of well-being are analyzed and reported for the region in which the respondent lives, by the size of their community, and for various individual characteristics (Appendix Table 9).

Younger persons are more likely than older persons to believe they are better off compared to five years ago and will be better off ten years from now. Seventy-three percent of persons age 19 to 29 feel they will be better off ten years from now. However, only nine percent of persons age 65 and older share this opinion. Both the oldest respondents and the youngest respondents are the groups most likely to believe they are better off compared to their parents when they were their age.

Persons with the highest household incomes are more likely than persons with lower incomes to feel they are better off compared to five years ago, are better off compared to their parents when they were their age, and will be better off ten years from now. For example, 62 percent of respondents with household incomes of $\$ 60,000$ or more think they are better off than they were five years ago. However, only 29 percent of persons with household incomes under $\$ 20,000$ believe they are better off than they were five years ago.

Persons with higher educational levels are more likely than persons with less education to think they are better off compared to five years ago, are better off compared to their parents when they were their age, and will be better off ten years from now. Fifty-seven percent of respondents with at least a fouryear college degree believe they are better off than they were five years ago. Only 33 percent of persons with a high school diploma or less education share this optimism.

When comparing the marital groups, respondents who have never married are the group most likely to believe they will be better off ten years from now. The married respondents join them as the groups most likely to believe they are better off than they were five years ago. The divorced/separated respondents are the marital group least likely to believe they are better off compared to their parents when they were their age.

Farmers and ranchers and persons with professional occupations are the occupation groups most likely to believe they are better off compared to five years ago.

Approximately 58 percent of persons with professional occupations and farmers and ranchers believe they are better off than they were five years ago, compared to only 36 percent of manual laborers (Figure 11). Persons with occupations classified as "other" are the group most likely to believe they will be better off ten years from now.

Latinos are more likely than non-Latinos to think they will be better off ten years from now. Seventy percent of Latinos say they will be better off ten years from now, compared to only 38 percent of non-Latinos.

Persons living in or near the largest communities are more likely than persons living in or near smaller communities to believe they will be better off ten years from now. Approximately 45 percent of persons living in or near communities with populations of 5,000 or more believe they will be better off ten years from now, compared to 35 percent of persons living in or near communities with less than 500 persons.

The respondents were also asked if they

Research Report 07-1 of the Center for Applied Rural Innovation
Page 17
believe people are powerless to control their own lives. When analyzing the responses by region, community size, and various individual attributes, many differences emerge (Appendix Table 10). Persons with lower educational levels are more likely than persons with more education to believe that people are powerless to control their own lives. Forty-nine percent of persons with a high school diploma or less education agree that people are powerless to control their own lives (Figure 12). However, only 26 percent of persons with a four-year college degree share this opinion.

Persons with lower household incomes are more likely than persons with higher incomes to agree with the statement. Forty-nine percent of persons with household incomes under $\$ 20,000$ believe people are powerless to control their own lives, compared to 28 percent of persons with household incomes of $\$ 60,000$ or more.

Research Report 07-1 of the Center for Applied Rural Innovation

Latinos are more likely than non-Latinos to believe people are powerless to control their own lives. Over one-half (51\%) of Latinos agree with the statement that people are powerless to control their own lives. Only 36 percent of non-Latinos agree with this statement.

The marital status groups most likely to believe people are powerless are both widowed respondents and respondents who are divorced/separated. When comparing responses by occupation, manual laborers are the group most likely to agree with this statement.

## Specific Aspects of Well-Being by Subgroups

The respondents were given a list of items that may influence their well-being and were asked to rate their satisfaction with each. The complete ratings for each item are listed in Appendix Table 11. At least one-third of respondents are very satisfied with their family (52\%), their marriage (47\%), their religion/ spirituality (44\%), their friends (41\%), and greenery and open space (39\%). Items receiving the highest proportion of very dissatisfied responses include: financial security during retirement (19\%), current income level (14\%), and job opportunities for you (12\%).

The top ten items people are dissatisfied with (determined by the largest proportions of "very dissatisfied" and "dissatisfied" responses) will now be examined in more detail by looking at how the different demographic subgroups view each item. These comparisons are shown in Appendix Table 12.

Page 18

Respondents’ satisfaction level with both their financial security during retirement and their current income level differ by most of the individual characteristics examined. Persons with lower household incomes are more likely than persons with higher incomes to be dissatisfied with both of these items. Fifty-five percent of persons with household incomes under \$20,000 report being dissatisfied with their current income level, compared to 18 percent of persons with household incomes of $\$ 60,000$ or more.

Respondents who are divorced or separated are the marital group most likely to be dissatisfied with both their financial security during retirement and their current income level. Sixty-five percent of divorced/ separated respondents are dissatisfied with their financial security during retirement, compared to 33 percent of widowed respondents.

When comparing responses by education level, persons with some college education are the group most likely to report being dissatisfied with these two items.

When comparing the age groups, persons between the ages of 40 and 49 are the group most likely to be dissatisfied with their financial security during retirement. The youngest persons (age 19 to 29) are the group most likely to express dissatisfaction with their current income level.

Females are more likely than males to express dissatisfaction with their financial security during retirement. When comparing responses by occupation, persons with service occupations are the group most likely to be dissatisfied with their financial security during retirement. But, persons with
occupations classified as "other" are most likely to be dissatisfied with their current income level.

Non-Latinos are more likely than Latinos to report dissatisfaction with their financial security during retirement. Latinos are more likely than non-Latinos to have no opinion about this item.

Persons with lower household incomes are more likely than persons with higher incomes to be dissatisfied with their job, their job security and their job opportunities. Fiftythree percent of persons with household incomes under $\$ 20,000$ are dissatisfied with their job opportunities, compared to 32 percent of persons with household incomes of $\$ 60,000$ or more.

Persons who are either divorced/separated or never married are the marital groups most likely to express dissatisfaction with these three job-related items (job satisfaction, job security and job opportunities). When comparing responses by age, persons under the age of 64 the groups most likely to be dissatisfied with these three job-related items.

When comparing responses by occupation, manual laborers and skilled laborers are the groups most likely to be dissatisfied with their job and their job security.

Females are more likely than males to report dissatisfaction with their job opportunities. Forty-seven percent of females are dissatisfied with the job opportunities for them, compared to 35 percent of males.

Latinos are more likely than non-Latinos to be dissatisfied with their job security. Thirty percent of Latinos are dissatisfied with their
job security, compared to 19 percent of nonLatinos.

Persons living in or near communities with populations ranging from 5,000 to 9,999 are more likely than persons living in communities of different sizes to express dissatisfaction with clean water. Twentynine percent of persons living in or near communities of this size are dissatisfied with clean water. Only 14 percent of persons living in or near communities with less than 500 people share this opinion.

Other groups most likely to express dissatisfaction with clean water include: persons with lower household incomes, younger persons and Latinos. Farmers and ranchers are the occupation group least likely to report being dissatisfied with clean water.

The groups most likely to be dissatisfied with their spare time include: persons under the age of 50 and persons with higher education levels. The widowed respondents are the marital group least likely to report being dissatisfied with their spare time.

The groups most likely to report being dissatisfied with their community include: persons under the age of 65, persons who are either divorced or separated or who have never married, and persons with occupations classified as "other."

The groups most likely to express dissatisfaction with their health include: persons with the lowest household incomes, respondents who are divorced/separated and both persons with occupations classified as "other" and persons with service occupations.

The groups most likely to be dissatisfied with
their housing are: persons with lower household incomes, younger respondents, and persons who have never married. Farmers and ranchers are the occupation group least likely to be dissatisfied with their housing.

## Conclusion

Rural Nebraskans are generally positive about their communities. The majority believe their community has either stayed the same or changed for the better during the past year. In addition, most characterize their communities as friendly, trusting and supportive. Many also say their community is very special to them and that they can be themselves in their community. One-half indicate it would be difficult for their household to move from their community. Furthermore, most rural Nebraskans are planning to stay in their community next year. Only six percent are planning to move and twelve percent are uncertain.

Many differences are detected by community size. Residents of larger communities are more likely than residents of smaller communities to think their community has changed for the better during the past year. However, residents of smaller communities are more likely than residents of larger communities to express positive sentiments about their community. The smaller community residents rate their communities higher on their social dimensions (as being friendly and trusting) and are more likely to have higher levels of attachment to their community. Thus, smaller communities have positive attributes that can be marketed to potential new residents.

Rural Nebraskans have generally positive
views about their current and future situation. Over one-third (41\%) of rural Nebraskans think they are better off than they were five years ago and will be better off ten years from now.

Certain groups remain pessimistic about their situation. Persons with lower household incomes, older persons, persons with lower educational levels and persons who are divorced or separated are the groups most likely to be more pessimistic about the present and the future.

When asked if they believe people are powerless to control their own lives, 38 percent of this year's respondents agreed. Widowed persons, persons who are divorced/separated, persons with lower educational levels, older persons, persons with lower household incomes, manual laborers and Latinos are the groups most likely to agree that people are powerless to control their own lives.

Rural Nebraskans continue to be most satisfied with family, spirituality, friends, and the outdoors. On the other hand, they continue to be less satisfied with job opportunities, their current income level, and financial security during retirement.

It is the policy of the University of Nebraska-Lincoln not to discriminate on the basis of sex, age, disability, race, color, religion, marital status, veteran's status, national or ethnic origin, or sexual orientation.

[^0]:    ${ }^{1}$ The responses on the 7 -point scale are converted to percentages as follows: values of 1,2 , and 3 are categorized as easy; values of 5,6 , and 7 are categorized as difficult; and a value of 4 is categorized as neutral.

[^1]:    * Chi-square values are statistically significant at the .05 level.

[^2]:    * Chi-square values are statistically significant at the .05 level.
    ** Only the ten items with the highest combined proportion of very and somewhat dissatisfied responses are included.

[^3]:    * Chi-square values are statistically significant at the .05 level.
    ** Only the ten items with the highest combined proportion of very and somewhat dissatisfied responses are included.
